

Ansys Mechanical Beyond the Basics

Module 06 Workshop: Expanded Results and Validation

Release 2021 R2

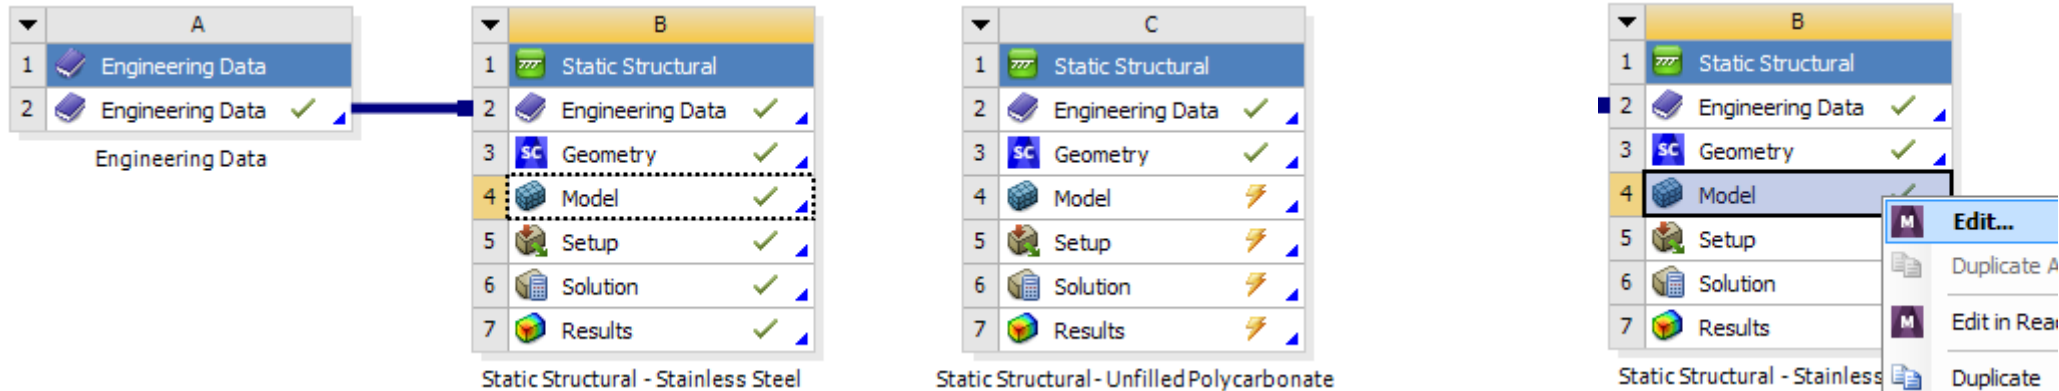

Workshop 06: Expanded Results and Validation

Use this guide to work on the Journal Bearing model.

Workshop 06: Expanded Results and Validation

- Open **Archive**: “Shaft_Bearings_WS06_Start.wbpz”
- In order to save some time, the project has already been solved for the Stainless Steel housing material option.
- Open Mechanical for the Stainless Steel material option, Analysis System B.

Workshop 06: Expanded Results and Validation

- Review **Total Deformation** and **Equivalent Stress** results for Time 3.0
- **Animate** results. Change the displacement scale factor as desired.
- **Review** results for each body, entering them into a table like the one below:

| | A | B | C | D | E | F |
|----|---|-------|-----------------|-----|------------------------|-----|
| 1 | | | Stainless Steel | | Unfilled Polycarbonate | |
| 2 | Results | Units | Min | Max | Min | Max |
| 3 | Total Deformation - 3. s | mm | | | | |
| 4 | Equivalent (von-Mises) Stress - 3. s | Mpa | | | | |
| 5 | Equivalent (von-Mises) Stress - Multiple - 3. s (housings) | MPa | | | | |
| 6 | Equivalent (von-Mises) Stress - Multiple - 3. s (bearings) | MPa | | | | |
| 7 | Equivalent (von-Mises) Stress - Component4\Shaft - 3. s | MPa | | | | |
| 8 | Total Deformation - Component4\Shaft - 3. s | mm | | | | |
| 9 | (UX**2+UZ**2)**0.5 - 3s | mm | | | | |
| 10 | (UX**2+UZ**2)**0.5 - 3 s | mm | | | | |
| 11 | | | | | | |
| 12 | Misalignment calculation | | | | | |

(see next slide)

Workshop 06: Expanded Results and Validation

- **Calculate misalignment:**
 - Q: Is the displacement vector in the same direction for both sides of the shaft? A: Yes, and this is different from the results observed in Module 08.
 - Q: How can we calculate the misalignment in this case? A: Subtract one vector from the other
- **Return to the Workbench** project page and Update Project in order to solve Analysis System C.

- Open Mechanical for the Polycarbonate material option, Analysis System C
- Review the results and finish filling in the results table. Compare misalignment with the first solution and draw conclusions. Focus in particular on the stress in the shaft.

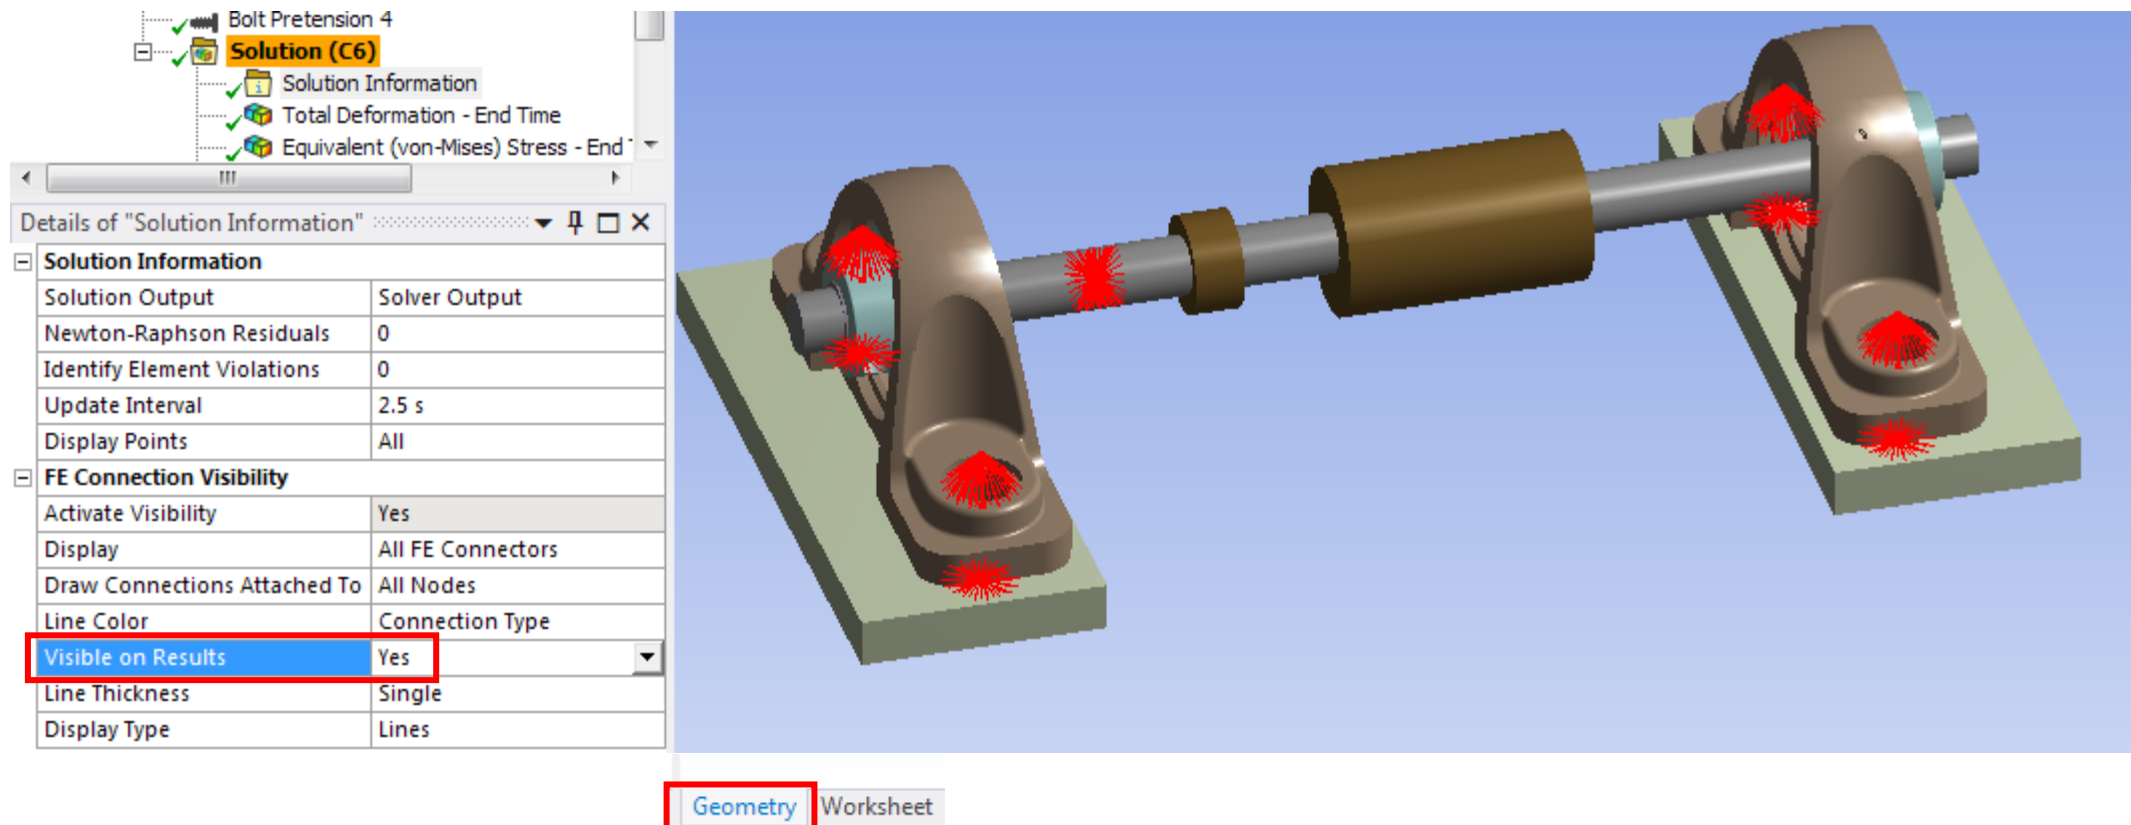

Workshop 06: Expanded Results and Validation

- Review both **Averaged** and **Unaveraged** stress results. What are your thoughts about the validity of the results?
- What would you recommend? (The **Averaged** and **Unaveraged** results are slightly different. If you observe local regions of high stresses in the results, check to see if they are near a boundary condition—in these locations, the results values should not be trusted. If the high stresses are not near a boundary condition, consider a mesh convergence study to achieve higher accuracy in those regions.)

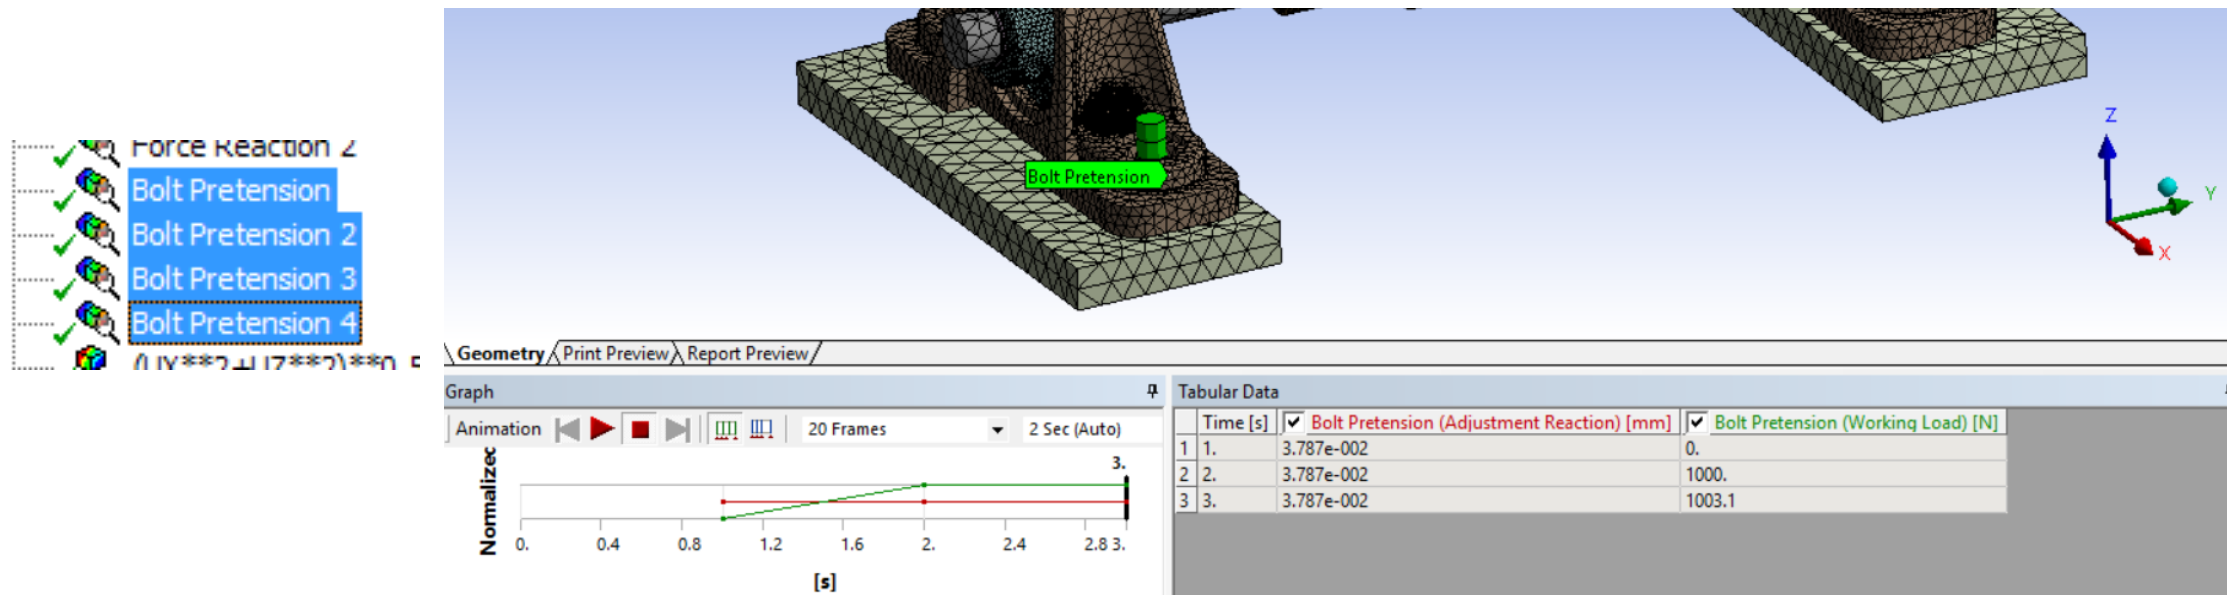

Workshop 06: Expanded Results and Validation

- Bolt postprocessing:
 - Graphically review the constraint equations near the bolts

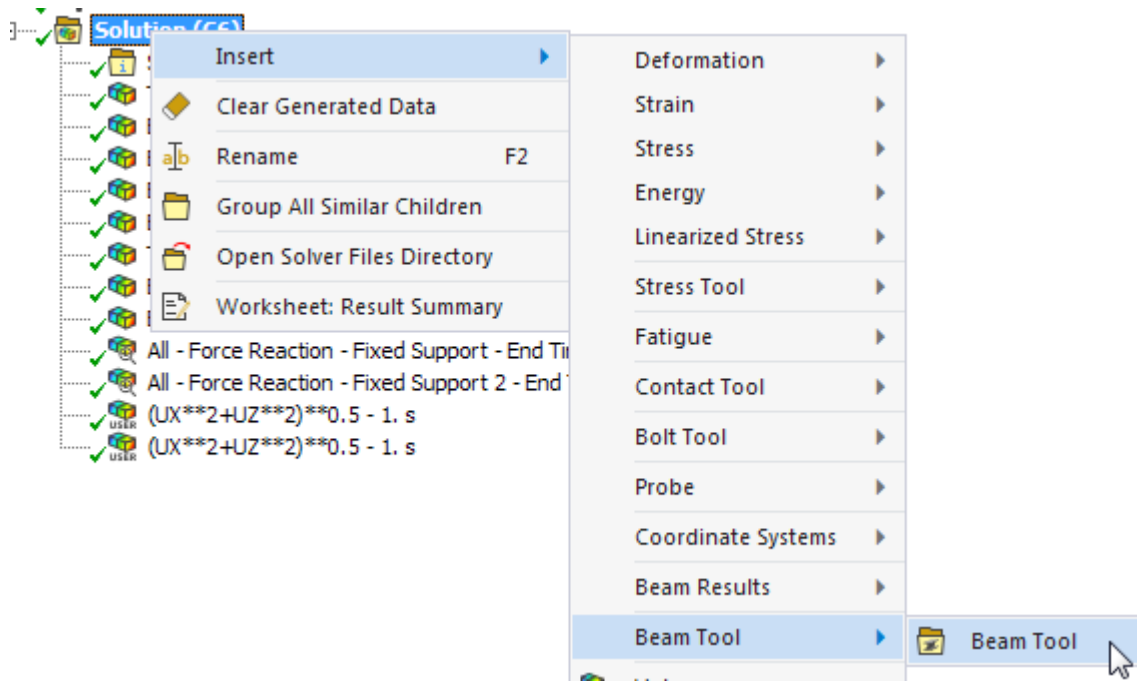

Workshop 06: Expanded Results and Validation

- Bolt postprocessing:
 - Retrieve clamping force for each bolt: drag and drop **Bolt Pretension** Loads onto the **Solution** branch
 - Consider what's happening in each bolt. Which bolt has the highest load?

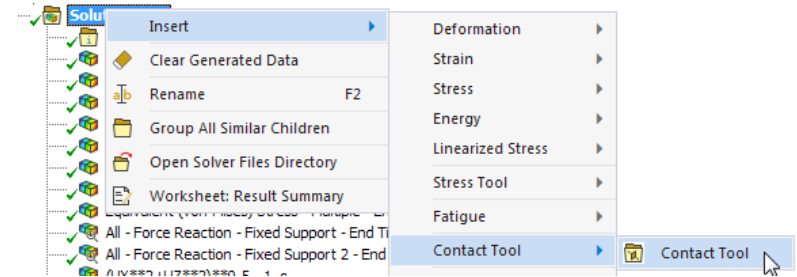

Workshop 06: Expanded Results and Validation

- Bolt postprocessing:
 - Review stresses (Direct, Min Combined, and Max Combined) in beam bodies using the Beam Tool
 - What are your conclusions? (Max Combined stress is high at certain locations, beyond yield stress)

Workshop 06: Expanded Results and Validation

- Contacts postprocessing:
 - Insert a **Contact Tool** to review Frictionless contact results between **Housing** bodies and **Ground** bodies
 - Review **Status**, **Gap**, and **Pressure**
 - Do the housings lift between the bolts?

Workshop 06: Expanded Results and Validation

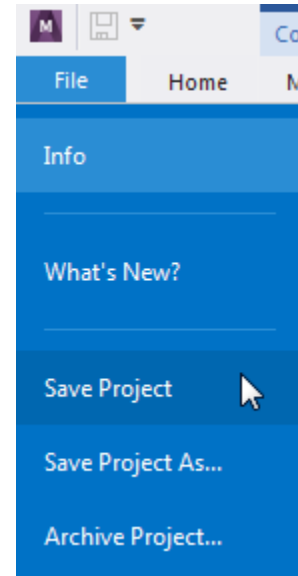

- Contacts postprocessing:
 - Review contact results on the Rings to Bearings contact regions
 - Is Frictional contact a good choice? Or should this contact pair be made linear?
- **Conclude:**
 - **Can Unfilled Polycarbonate replace Stainless Steel for the Housings?**

Recall that the misalignment values must not be different by more than 5 % between simulations for both Stainless Steel and Polycarbonate materials.

Equivalent Stress must not be greater than the yield strength for each material.

/ Workshop 06: Expanded Results and Validation

Save Project for use later if desired.

 **Ansys**
